Rotaract Club of Xiamen University Malaysia

Rotary Club of Kuala Lumpur Dynamics

Rotary Club of Tun Razak Exchange

SDC Hackathon

Technical Tools Declaration

Hosted by Xiamen University Malaysia (XMUM) AI Club
Submission Deadline: 25 October 2026

Instructions: Declare every API, cloud service, AI tool, dataset, model, and sponsor resource your team used to build the project. Complete every section; where a category does not apply, tick "No" or write "None" – do not leave it blank. Submit as a single PDF document named "SDC2026_TeamName_TechDeclaration.pdf" together with your project submission. Undeclared third-party resources discovered at judging may affect your score or eligibility.

SDC HACKATHON 2026

Technical & Tools Declaration

Hosted by Xiamen University Malaysia (XMUM) AI Club

Submission Deadline: [Insert date]

Instructions: Declare every API, cloud service, AI tool, dataset, model, and sponsor resource your team used to build the project. Complete every section; where a category does not apply, tick "No" or write "None" – do not leave it blank. Submit as a single PDF document named "SDC2026_TeamName_TechDeclaration.pdf" together with your project submission. Undeclared third-party resources discovered at judging may affect your score or eligibility.

1. Team & Project Overview

Team Name	Kebanggaan Universiti Malaya (KUM)
Project / Solution Name	Dispatch Hub
Name (Leader)	Tan Kai Xue
Email & Phone (Leader)	duopoitan@gmail.com / 0167158480
University Affiliation(s)	Universiti Malaya
Live Prototype URL	https://sdc-hackathon-2.replit.app/
Code Repository URL (public / access granted to judges)	https://github.com/ethanjaydee/SDC-hackathon

2. Architecture & Technology Stack

2.1 System Architecture Overview

Describe how the components declared in this document connect end-to-end (e.g., user interface → backend → AI model/API → database → cloud hosting). Attach a system block diagram as an appendix if available.

[Maximum 200 words]

Dispatch Hub has a React web interface for Boss and Technician demo views. The interface requests data from a Node.js/Express API hosted separately on Replit. The API validates requests, applies dispatch and completion rules, and reads or updates the project's SQLite database.

For AI-assisted work, the API sends customer repair notes or review feedback to a RunPod Serverless endpoint. It validates the response before returning it to the interface.

For routing, the API can request driving-route data from Google Routes using the server-side GOOGLE_MAPS_API_KEY. The interface can show map information or offer a link to open directions in Google Maps.

When a technician accepts or completes a dispatched job, the interface sends the action to the API. The API checks and records the change in SQLite, then returns updated status for the interface to display.

The frontend and API are configured as separate Replit artifacts: the frontend is built and served as a static web app, while the Express API runs as a server process. The current database is a local SQLite file, not a managed cloud database. The project's job data and locations are synthetic samples.

2.2 Languages, Frameworks & Libraries

List the main programming languages, frameworks, and third-party libraries that your team did not create. Open-source use is permitted provided it is declared and properly licensed/attributed.

Name & Version	Purpose in Project	License
TypeScript and JavaScript	application and server code	
HTML and CSS	web document and styling	
SQL	database schema and queries	

Name & Version	Purpose in Project	License
Node.js	server runtime	
pnpm	package manager	

3. APIs & Cloud Services

3.1 External APIs

List every external API your solution calls (GenAI, maps, payments, messaging, data feeds, etc.). Do not include API keys or secrets in this document.

API & Provider	Purpose in Project	Access Tier (free / paid / sponsor-provided)
Google Maps API	Showing route when dispatching	Free Trial
Telegram API	Pretending to be a customer	Free
RunPod Serverless	AI inference for job analysis and related summaries.	sponsor-provided
Replit	application hosting and platform services.	sponsor-provided

3.2 Cloud Platforms & Deployment

List every cloud service used for hosting, storage, databases, authentication, or compute, and indicate how the prototype is deployed.

Service & Provider	Purpose in Project	Plan / Region
Replit	Hosting	serves the Dispatch Hub frontend
Local SQLite file	Database and storage	The API uses SQLite on its local filesystem
RunPod Serverless	AI compute	The API can send AI analysis and summary
Google Maps Platform	Maps and routing	The API can call Google Routes for driving-route data.

Service & Provider	Purpose in Project	Plan / Region
Telegram Bot API	Messaging, optional	bring Telegram messages into the demo inbox and send replies.

4. AI Tools, Models & Datasets

4.1 AI Models Used in the Solution

List every AI model embedded in or called by your application, including pre-trained, fine-tuned, and self-trained models.

Model & Version	Source / Provider	Usage (pre-trained / fine-tuned / self-trained)	License / Terms
glm-5.3	Runpod public endpoint	finetuned	

4.2 Datasets

List all datasets used for training, fine-tuning, evaluation, or in the running application. State clearly if a dataset contains personal or sensitive data.

Dataset Name	Source / URL	Type (public / private / self-collected / synthetic)	License	Personal Data? (Y/N)
NONE				

4.3 AI-Assisted Development Tools

Tools used to help write code, design, content, or documentation (e.g., chat assistants, code completion tools, image generators). Declaring these tools does not reduce your score; undeclared use may.

Did your team use any generative-AI tool to help create code, design, text, or other project material?

☑ Yes ☐ No

If yes, list them below:

Tool & Version	**Used For**	**Extent of Use (minor / moderate / major)**
Replit	Vibe coding for the website	major
Gemini 3.1 Pro	Asking how to connect runpod with replit	minor
Claude	Help with creating slide deck	minor
Github Co-pilot	Assist with writing readme	minor

Briefly describe how your team reviewed, tested, and took responsibility for AI-generated output:

[Maximum 100 words]

Our team make sure idea are not generated by ai and due to lack knowledge of computing, we use replit to vibe coding the website, for the gemini 3.1 Pro, we really really couldn't find any reference in google so we ask ai, but at the end it doesn't help much, for claude we use for creating slide for presentation and co-pilot for editing the github readme file. We seriously took responsibility for not generating idea from ai to learn new knowledge

5. Sponsor-Provided Resources

Declare any official SDC sponsor-provided GenAI API, cloud credits, tools, mentoring, or data that your team used.

Did your project use any official SDC sponsor-provided resource?

☑ Yes ☐ No

If yes, list them below:

Sponsor	**Resource (API / credits / platform / data)**	**How It Was Used in the Project**
Replit	Credits	Vibe coding the website
Runpod	Credits	For ai summary

Was the sponsor resource essential to the core functionality of the prototype, or could it be replaced? Explain briefly:

[Maximum 100 words]

It's important for the prototype because we don't know how to code and the runpod is important to use ai in system. It could be replaced by other ai but we rather to use replit just to gain new experience on learning how to deploy it.

6. Security, Privacy & Responsible Use

6.1 Data Handling & Privacy

What user or personal data does your application collect, store, or send to third-party services (including AI APIs)? How is it protected, and how long is it kept? State "No user data is collected" if applicable.

[Maximum 150 words]

The selected demo role and technician ID are kept in session storage until the tab closes. Messages and notes can contain personal information even though the demo's preloaded names, contact details, and locations are fictional. The data went outside the map is only AI requests that include repair notes or conversation transcripts, technician-candidate details for recommendations, low-rated review comments, and sample invoice fields. For telegram, incoming private messages are received through the bot API, and staff replies are sent back through Telegram. Google Maps use for route requests send origin and destination coordinates. Telegram chat IDs are encrypted at rest using AES-256-GCM, with a key derived from SESSION_SECRET. The general SQLite records are not encrypted by the application. RunPod and Google credentials are intended to be server-side environment secrets.

6.2 Known Limitations & Risks

Identify the main technical limitations of your AI components (e.g., hallucination, bias, rate limits, dependency on a single provider) and any mitigation you have implemented.

[Maximum 150 words]

RunPod requests have timeouts: generally, 5 seconds for triage and technician recommendations, and 20 seconds for review summaries and sample e-invoices. Repair analysis and recommendations fall back to local rules if the AI call fails.

7. Compliance & Readiness Checklist

Tick all boxes that apply before submitting.

- ☑ All APIs, cloud services, AI tools, models, and datasets used in the project are declared in this document.
- ☑ All third-party code, datasets, and models are used in accordance with their licenses, and attribution is provided where required.
- ☑ No API keys, passwords, or other credentials are exposed in the code repository, prototype, or this document.
- ☑ Any use of generative-AI tools for development has been disclosed and reviewed by the team.
- ☑ Any use of official SDC sponsor resources has been declared in Section 5.
- ☑ The prototype described here is accessible to judges through the links provided in Section 1.
- ☑ All fields in this template have been completed within the word limits stated.

8. Declaration

By submitting this document, the team leader confirms that the information provided is complete and accurate to the best of the team's knowledge, and that every API, cloud service, AI tool, dataset, model, and sponsor resource used in the project has been declared.

25 October 2026
